File: /root/Downloads/build/qark/cfr/com/google/android/gms/iid/InstanceID.java:110:13

WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. Reference: https://bitbucket.org/secure-it-i/android-app-vulnerability-benchmarks/src/d5305b9481df3502e60e98fa352d5f58e4a69044/ICC/WeakChecksOnDynamicInvocation-InformationExposure/?at=master

WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. Reference: https://bitbucket.org/secure-it-i/android-app-vulnerability-benchmarks/src/d5305b9481df3502e60e98fa352d5f58e4a69044/ICC/WeakChecksOnDynamicInvocation-InformationExposure/?at=master

INFO Protected Exported Tags

The receiver androidx.work.impl.background.systemalarm.ConstraintProxy$BatteryNotLowProxy is exported, but the associated Intents can only be sent by SYSTEM level apps. They could still potentially be vulnerable, if the Intent carries data that is tainted (2nd order injection)

File: /root/Downloads/build/qark/assets/dump.bin:16834:0

WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. INFO Exported Tag With Permission

The receiver org.thoughtcrime.securesms.gcm.GcmBroadcastReceiver tag is exported and protected by a permission, but the permission can be obtained by malicious apps installed prior to this one. More info: https://github.com/commonsguy/cwac-security/blob/master/PERMS.md. Failing to protect receiver tags could leave them vulnerable to attack by malicious apps. The receiver tags should be reviewed for vulnerabilities, such as injection and information leakage.

WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. Reference: https://bitbucket.org/secure-it-i/android-app-vulnerability-benchmarks/src/d5305b9481df3502e60e98fa352d5f58e4a69044/ICC/WeakChecksOnDynamicInvocation-InformationExposure/?at=master

INFO Exported Tag With Permission

The service org.thoughtcrime.securesms.service.DirectShareService tag is exported and protected by a permission, but the permission can be obtained by malicious apps installed prior to this one. More info: https://github.com/commonsguy/cwac-security/blob/master/PERMS.md. Failing to protect service tags could leave them vulnerable to attack by malicious apps. The service tags should be reviewed for vulnerabilities, such as injection and information leakage.

WARNING BaseURL set for Webview

This webView sets the BaseURL. You should verify that this is only loading content from this domain. Loading content from a domain you do not control, or using plain-text HTTP, leaves this vulnerable to injection attacks against the BaseURL domain.

WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. Reference: https://bitbucket.org/secure-it-i/android-app-vulnerability-benchmarks/src/d5305b9481df3502e60e98fa352d5f58e4a69044/ICC/WeakChecksOnDynamicInvocation-InformationExposure/?at=master

WARNING Potientially vulnerable check permission function called

Be careful with use of Check permission function App maybe vulnerable to Privilege escalation or Confused Deputy Attack. This function can grant access to malicious application, lacking the appropriate permission, by assuming your applications permissions. This means a malicious application, without appropriate permissions, can bypass its permission check by using your applicationpermission to get access to otherwise denied resources. Use -checkCallingPermission instead. Reference: https://developer.android.com/reference/android/content/Context.html

WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. WARNING Broadcast sent with receiverPermission with minimum SDK under 21

A broadcast, sendBroadcast which specifies the receiverPermission, but may still be vulnerable to interception, due to the permission squatting vulnerability in API levels before 21. This means any application, installed prior to the expected receiver(s) on the device can potentially receive this broadcast. You should investigate this for potential data leakage.

WARNING Potientially vulnerable check permission function called

Be careful with use of Check permission function App maybe vulnerable to Privilege escalation or Confused Deputy Attack. This function can grant access to malicious application, lacking the appropriate permission, by assuming your applications permissions. This means a malicious application, without appropriate permissions, can bypass its permission check by using your applicationpermission to get access to otherwise denied resources. Use -checkCallingPermission instead. Reference: https://developer.android.com/reference/android/content/Context.html

WARNING Ordered broadcast sent with receiverPermission with minimum SDK under 21

A broadcast, sendOrderedBroadcast which specifies the receiverPermission, but may still be vulnerable to interception, due to the permission squatting vulnerability in API levels before 21. This means any application, installed prior to the expected receiver(s) on the device can potentially receive this broadcast. You should investigate this for potential data leakage.

WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. Reference: https://bitbucket.org/secure-it-i/android-app-vulnerability-benchmarks/src/d5305b9481df3502e60e98fa352d5f58e4a69044/ICC/WeakChecksOnDynamicInvocation-InformationExposure/?at=master

WARNING Ordered broadcast sent with receiverPermission with minimum SDK under 21

A broadcast, sendOrderedBroadcast which specifies the receiverPermission, but may still be vulnerable to interception, due to the permission squatting vulnerability in API levels before 21. This means any application, installed prior to the expected receiver(s) on the device can potentially receive this broadcast. You should investigate this for potential data leakage.

WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. Reference: https://bitbucket.org/secure-it-i/android-app-vulnerability-benchmarks/src/d5305b9481df3502e60e98fa352d5f58e4a69044/ICC/WeakChecksOnDynamicInvocation-InformationExposure/?at=master

WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. Reference: https://bitbucket.org/secure-it-i/android-app-vulnerability-benchmarks/src/d5305b9481df3502e60e98fa352d5f58e4a69044/ICC/WeakChecksOnDynamicInvocation-InformationExposure/?at=master

WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. Reference: https://bitbucket.org/secure-it-i/android-app-vulnerability-benchmarks/src/d5305b9481df3502e60e98fa352d5f58e4a69044/ICC/WeakChecksOnDynamicInvocation-InformationExposure/?at=master

WARNING Ordered broadcast sent with receiverPermission with minimum SDK under 21

A broadcast, sendOrderedBroadcast which specifies the receiverPermission, but may still be vulnerable to interception, due to the permission squatting vulnerability in API levels before 21. This means any application, installed prior to the expected receiver(s) on the device can potentially receive this broadcast. You should investigate this for potential data leakage.

WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. Reference:

WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. WARNING Broadcast sent with receiverPermission with minimum SDK under 21

A broadcast, sendBroadcast which specifies the receiverPermission, but may still be vulnerable to interception, due to the permission squatting vulnerability in API levels before 21. This means any application, installed prior to the expected receiver(s) on the device can potentially receive this broadcast. You should investigate this for potential data leakage.

WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. Reference: https://bitbucket.org/secure-it-i/android-app-vulnerability-benchmarks/src/d5305b9481df3502e60e98fa352d5f58e4a69044/ICC/WeakChecksOnDynamicInvocation-InformationExposure/?at=master

WARNING Potientially vulnerable check permission function called

Be careful with use of Check permission function App maybe vulnerable to Privilege escalation or Confused Deputy Attack. This function can grant access to malicious application, lacking the appropriate permission, by assuming your applications permissions. This means a malicious application, without appropriate permissions, can bypass its permission check by using your applicationpermission to get access to otherwise denied resources. Use -checkCallingPermission instead. Reference: https://developer.android.com/reference/android/content/Context.html

WARNING Insecure functions found

The Content provider API provides a method call. The framework does no permission checking on this entry into the content provider besides the basic ability for the application to get access to the provider at all. Any implementation of this method must do its own permission checks on incoming calls to make sure they are allowed. Failure to do so will allow unauthorized components to interact with the content provider. Reference: https://bitbucket.org/secure-it-i/android-app-vulnerability-benchmarks/src/d5305b9481df3502e60e98fa352d5f58e4a69044/ICC/WeakChecksOnDynamicInvocation-InformationExposure/?at=master

WARNING Potientially vulnerable check permission function called

Be careful with use of Check permission function App maybe vulnerable to Privilege escalation or Confused Deputy Attack. This function can grant access to malicious application, lacking the appropriate permission, by assuming your applications permissions. This means a malicious application, without appropriate permissions, can bypass its permission check by using your applicationpermission to get access to otherwise denied resources. Use -checkCallingPermission instead. Reference: https://developer.android.com/reference/android/content/Context.html
